

Worksheet - 3 : Amount of Turn & Comparing Angles

Section A: MCQ

- ①. The size of an angle is measured by its:
a) Arm length b) Amount of turn/rotation.
c) Thickness of the line d) Vertex size.
- ②. To Compare two angles without measuring, we can use the method of:
a) Superimposition b) Guessing c) Extending arms
d) Drawing lines
- ③. When placing one angle over another to compare them, what must perfectly overlap?
a) The tips of the arrows b) The vertices
c) The right arms only d) The paper edges
- ④. Two cranes open their beaks. Crane A's beak has longer than Crane B's beak, but Crane B opens its beak wider. who is making a larger angle?
a) Crane A b) Crane B c) Both are equal d) Can not be determined.
- ⑤. If two angles overlap perfectly (vertices and both arm coincide) the angles are:
a) unequal b) Parallel c) equal in size.
d) opposite.

Section B: True Or False

6. Increasing the length of the rays drawn on paper increases the angle.
7. A transparent tracing paper can be used to compare two angles.
8. The angle of an open door changes depending on how far you push it.
9. Two different paper rotating arms can pass through the same angle slit only if their arm lengths are exactly the same.
10. Superimposition means placing one figure exactly over ~~the~~ another.

Section C: Application & Logical Reasoning

11. ~~Draws small~~
a laptop screen is opened slightly. If you open it further, what happens to the angle between the keyboard and the screen?
12. Riya says, "Angle ABC is bigger than Angle DEF because the line drawn for ABC are longer."
Correct Riya's misconception.
13. How can you compare the angle of a sliced piece of pizza with a slice of cake without using any tools?
14. If rotating arm A fits perfectly into a cardboard slit, and rotating arm B also fits perfectly into the same slit, what can you say about arm A & arm B?
